Supplementary Figure 2. Modulation of CD1a expression by TGF- β .

Monocytes were incubated for 5 days with IL-4 and GM-CSF, in the presence or not of TGF- β (concentrations as indicated). At day 5, expression of CD1a and CD14 was analysed by flow cytometry. **(A)** Results from individual donors are expressed as % of CD1a+CD14- cells with median bar (n = 10). **(B)** Quantification of CD1a expression in the CD1a+CD14- subpopulation, showed as MFI (mean \pm SEM, n = 10). # indicates $p < 0.05$ as calculated after repeated-measures one-way ANOVA analysis.
